List of experiments

1. **Temperature Plot**

   - Plot the temperature values throughout the search.
   - The X-axis represents the iteration number, and the Y-axis represents the temperature.
   - Generate plots for both the smallest and largest instance sizes.

2. **Probability of Acceptance Plot**

   - Plot the probability of acceptance throughout the search, considering only iterations where the objective value worsens (positive delta).
   - Use a scatter plot with the X-axis as the iteration number and the Y-axis as the probability of acceptance.
   - Generate plots for both the smallest and largest instance sizes.

3. **Best Solution Iteration Report**

   - Identify and report the iteration number (i^*) at which the best solution is found.
   - Provide this information for all 10 runs across all instances.

4. **Delta Value per Operator Plot**

   - Plot the delta values (change in objective value) for each operator, representing the difference before and after applying the operator.
   - Use a scatter plot with the X-axis as the iteration number and the Y-axis as the delta value, considering only iterations where the specific operator was used.
   - Generate separate plots for each operator.
   - Plot data for all instances, but only for the run where the best solution was achieved.

5. **Operator Weights Plot**

   - Plot the weights of the operators across different segments.
   - Use different colors to distinguish between operators.
   - The X-axis represents the segment number, and the Y-axis represents the weights of the operators.
   - Generate plots for all instances, considering only the run where the best solution was achieved.

6. **Objective Value Report**

   - Report the final objective values from all 10 runs for each instance.
